The patent discloses novel polynucleotides encoding Exophiala spinifera funchial degradative or transport enzymes such as flavin annonoxygenase, funchial degradative or transport enzymes such as flavin annonoxygenase, and projection. A funchisin esterase enzyme with at least one funchisin degradative enzyme is useful for enzyme with at least one funchisin or a structurally related mycrotxin present in harvested grain, on application to a plant or to harvested grain or a structurally related mycrotxin present in harvested grain, on application to a plant or to be used as animal curvention are useful as probes and primers. They can be introduced invention are useful as probes and primers. They can be introduced for into micropaphisms that multiply on plants to deliver enzymes to potential target crops. The genes encoding the degrading enzymes are introduced to the environment, plants or animals for reducing the pathogenicity of a fungus producing funchish. The genes of the pathogenicity of a fungus producing funchish. The genes of the pathogenicity of a fungus producing funchish. The grees of the can be used alone or in combination to engineer microbes or other corpusations to maintain the present DNA sequence is the p-glycoprotein coding sequence from Exophiala spinifera.
                                                                                                                      Novel polynucleotides encoding Exophiala degradative or transport enzyme which is useful for detoxifying fumonisin or structurally related mycotoxin during processing of grain for human or animal food consumption

```
The patent discloses novel polynucleotides encoding Exophiala spinifera
funonisin degradative or transport enzymes such as flavin monooxygenase,
aldehyde dehydrogenase, permease and p-djycoprotein. A fumonisin esterase
enzyme with at least one fumonisin degradative enzyme is useful for
aldehyde dehydrogenase, permease and p-djycoprotein. A fumonisin esterase
enzyme with at least one fumonisin of a structurally related mycotoxin present in
harvested grain, on application to a plant or to harvested grain
during processing, or to processed grain that is to be used as animal
contains are useful as probes and primers. They can be introduced
or harvested grain as probes and primers. They can be introduced
into microorganisms that multiply on plants to deliver enzymes are
introduced via a vector into a microbial host and the transformed host
controlled to the environment, plants or animals for reducing the
pathogenicity of a fungus producing fumonish. The genes of the
pathogenicity of a fungus producing fumonish. The genes of the
contains are fermented in a bacterial host and the resulting bacteria
is processed and used as a microbial spray. The nucleotide sequences
con be used alone or in combination to engineer microbes or other
corganisms to metabolise fumonish and resist its toxic effects.
The present sequence is a genomic DNA encoding Exophiala spinifera
                                                                                                                                                                                                                                                                               Fumonisin; degradative enzyme; transport enzyme; flavin monooxygenase; aldehyde dehydrogenase; permease; pelyrooprotein; fumonisin esterase; detoxification; mycotoxin; animal feed; human feed; silage; transgenic animal; microbial spray; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel polynucleotides encoding Exophiala degradative or transport enzyme which is useful for detoxifying fumonisin or structurally related mycotoxin during processing of grain for human or animal food consumption
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         OR;

The invention relates to a multiple drug resistance gene atrC of Aspergillus nidians. Host cells transformed with vectors comprising the atrC gene are used for the recombinant expression of atrC polypeptide. The atrC polymeteotide is used to produce nucleic acid molecules which are useful in disponsitic assays for detection of atrC polymeteotides. The atrC polypeptide may be used to identify agents which inhibit multiple drug resistance. These agents may be useful for the treatment of tingal diseases. New antifungal compounds may abe lateful for the treatment of the gene disruption or gene replacement strains of Aspergillus nidulans. The present sequence represents the CDNA encoding atrC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       882

                                                                                                                                                                                                                                                      The invention relates to a multiple drug resistance gene atrC of Aspergillus nidulars. Host cells transformed with vectors comptising the atrC gene are used for the recombinant expression of atrC polypeptide. The atrC polynucleotide is used to produce nucleic acid molecules which are useful in diagnostic assays for detection of atrC polynucleotides. The atrC polypeptide may be used to identify agents which inhibit multiple drug resistance. These agents may be useful for the treatment of thingal diseases. New antifungal compounds may also be identified using the gene disruption or gene replacement strains of Aspergillus nidulans. The present sequence represents the atrC mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       522

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes a multiple drug resistance protein, designated atrD, which is isolated from Aspergillus nidulans. The atrD polymorlectide is used to produce nucleic acid molecules which are useful in diagnostic assays for the detection of atrD polymorlectides. The atrD polypeptide may be used to identify agents which inhibit multiple drug resistance. These agents may be useful for the treatment of fungal diseases. New antifungal compounds may also be identified using the gene disruption or gene replacement strains of Aspergillus nidulans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gaagogitcaaggoogaigiggaicaittogiocigiggiiogiciaciottiaitggg 321

The specification describes a method whereby cultured transformed fungal cells are used to determine the multiple drug inhibition activity of a compound. The method is useful for providing nucleic acid molecules which encode multiple drug resistance proteins from Aspergillus fumigatus (Atu) which are useful for determining the MDR Inhibition of a compound.

The invention relates to a method for enhancing the secretion of beta-
lactam compounds from a micro-organism that comprises enhancing ABC dadenosine triphosphate (ATP)-binding cassette) transporter activity of the micro-organism. The method is used for enhancing the production and secretions of beta-lactam antibiotics like penicillin and cephalosporins. Manipulation of the ABC-transport protein system provides a means for enhancing beta-lactam secretion. The present sequence represents the genomic DNA sequence of the P. chrysogenum ABC transporter as10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enhancing secretion of beta-lactam compounds from a micro-organism by enhancing adenosine triphosphate-binding cassette transporter activity, useful for producing e.g. penicillin and cephalosporins -

The invention relates to a method for enhancing the secretion of beta-lactam compounds from a micro-organism that comprises enhancing ABC (adenosine triphosphate (ATP)-binding cassette) transporter activity of the micro-organism. The method is used for enhancing the production and secretions of beta-lactam antibiotics like penicillin and cephalosporins. Manipulation of the ABC-transport protein system provides a means for enhancing beta-lactam secretion. The present sequence represents the genomic DNA sequence of the P. chrysogenum ABC transporter aal0.
                                                                                                                                                     Enhancing secretion of beta-lactam compounds from a micro-organism by enhancing adenosine triphosphate-binding cassette transporter activity, useful for producing e.g. penicillin and cephalosporins

```
The present sequence encodes the multiple drug resistance protein of Aspergilius funigatus, designated Afunbail. The specification describes a method whereby cultured transformed fungal cells are used to determine the multiple drug inhibition activity of a compound. The method is useful for providing nucleic acid molecules which encode multiple drug resistance proteins from Aspergillus fumigatus (Afu) which are useful for determining the WDR inhibition of a compound.
                                                                                                                                                                                                                                                                                                              Drug resistance gene from Aspergillus fumigatus useful for determining fungal multiple resistance inhibition activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 4800 BP; 1150 A; 1180 C; 1172 G; 1298 T; 0 other;

multiple drug resistance gene of Aspergillus flavus · used to ntify cpds. that inhibit fungal multiple drug resistance activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                           A cDNA clone (AAT35230) codes for a multiple drug resistance (MDR) protein (AAR99255), designated Afl-MDR1, of Aspergillus flavus. A cDNA library derived from mRNA of logarithmic phase mycella of A. flavus was screened with a probe obtd. by PCR amplification (see also AAT35231-32) of Afl-MDR1 genomic DNA present in pPSR-6 to obtain the full-length cDNA clone. The cDNA can be incorporated into a vector and utilised for prodn. of recombinant Afl-MDR1 in transformed host cells, pref. Saccharomyces cerevisiae, for use in identifying cpds. that inhibit fungal MDR activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 3923 BP; 915 A; 1018 C; 1020 G; 970 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence encodes a multiple drug resistance protein of Cryptococcus neoformans, designated CneMDR. Host cells transformed with the DNA sequence are useful for identification of potential antifungal compounds, and for enhancing the activity of proven antifungal compounds to previously resistant species.

```
The invention relates to a method for enhancing the secretion of beta-lactam compounds from a micro-organism that comprises enhancing ABC (adenosine triphosphate (ATP)-binding cassette) transporter activity of the micro-organism. The method is used for enhancing the production and secretions of beta-lactam antibiotics like penicillin and cephalosporins. Manipulation of the ABC-transport protein system provides a means for enhancing beta-lactam secretion. The present sequence represents a partial cDNA sequence of the P. chrysogenum ABC transporter aal0.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enhancing secretion of beta-lactam compounds from a micro-organism by enhancing adenosine triphosphate-binding cassette transporter activity, useful for producing e.g. penicillin and cephalosporins -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   qq
                                                                                                                                                                                                                                                                                                                                                                                                                                   5
                                                                                                                                                                                                                                          The invention relates to a method for enhancing the secretion of beta-lactam compounds from a micro-organism that comprises enhancing ABC (adenosine triphosphate (ATP)-binding cassette) transporter activity of the micro-organism. The method is used for enhancing the production and secretions of beta-lactam antibiotics like penicillin and cephalosporins. Manipulation of the ABC-transport protein system provides a means for enhancing beta-lactam secretion. The present sequence represents the genomic DNA sequence of the P. chrysogenum ABC transporter aal.
                                                                                                                                                                 Enhancing secretion of beta-lactam compounds from a micro-organism by enhancing adenosine triphosphate-binding cassette transporter activity, useful for producing e.g. penicillin and cephalosporins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2170

The invention relates to a method for enhancing the secretion of beta-lactam compounds from a micro-organism that comprises enhancing ABC (adenosine triphosphate (ATP)-binding cassette) transporter extrivity of the micro-organism. The method is used for enhancing the production and secretions of beta-lactam antibiotics like penicillin and cephalosporins. Manipulation of the ABC-transport protein system provides a means for enhancing beta-lactam secretion. The present sequence represents the genomic DNA sequence of the P. chrysogenum ABC transporter aal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enhancing secretion of beta-lactam compounds from a micro-organism by enhancing adenosine triphosphate-binding cassette transporter activity, useful for producing e.g. penicillin and cephalosporins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1751 cictactictitgicatiggectitgeegatictititaactiatggatacageacact 1810

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10176-ABL30511), expressed DNA sequences (ABL10176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                           caaactagccactgtcaaaagtgctggcaacatcgcagtcatttcccaggggaaaatcgt 1796
